# THE INTERNET AND SECURITY

N ANAND

# WHAT IS INTERNET?

- ▶ Interconnected Network of **Networks**

## LET'S GO BACK IN TIME.!

(1960 -70)

- ▶ Packet Switching - core of the Internet
- ▶ A move from
  - ▶ Circuit Switching
  - ▶ Message Switching

# SWITCHING TECHNIQUES – CIRCUIT SWITCHING

Wait for the circuit to be established!

# SWITCHING TECHNIQUES – MESSAGE SWITCHING

Message buffered at intermediate nodes

# SWITCHING TECHNIQUES – PACKET SWITCHING

Message split into smaller packets!

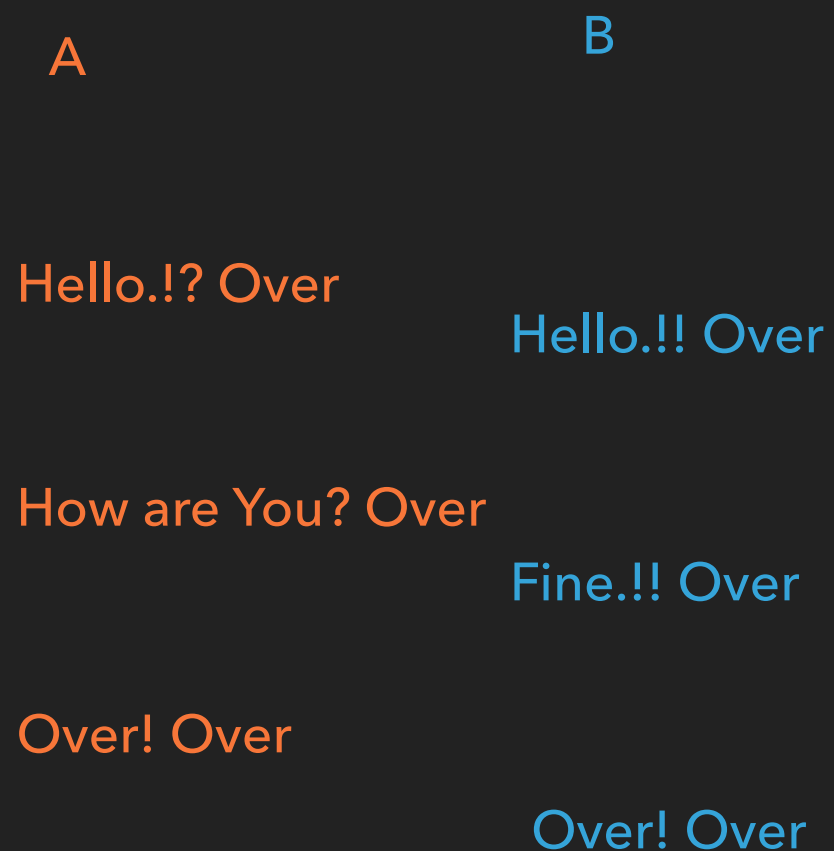

## ARPANET – ADVANCED RESEARCH PROJECTS AGENCY NETWORK

- ▶ First packet switched **Wide Area Network**
- ▶ **'lo'** sent at 10:30 pm on October 29, 1969
- ▶ TCP/ IP development began.
- ▶ Eventually more computers were connected
- ▶ ARPANET was decommissioned on 28 February 1990

# PROTOCOL

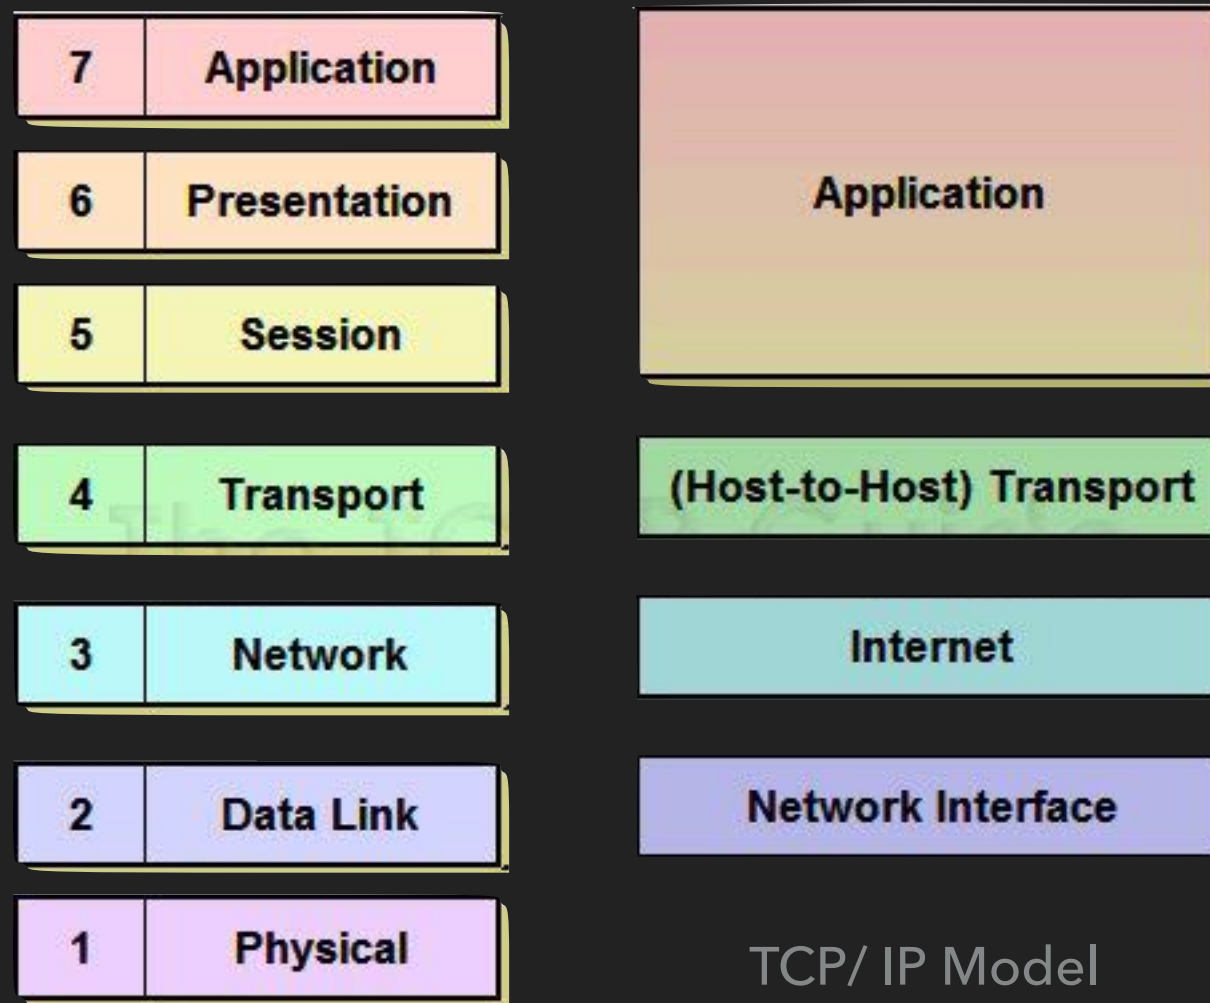

- ▶ Defines rules of Communication

# WHAT MAKES INTERNET?

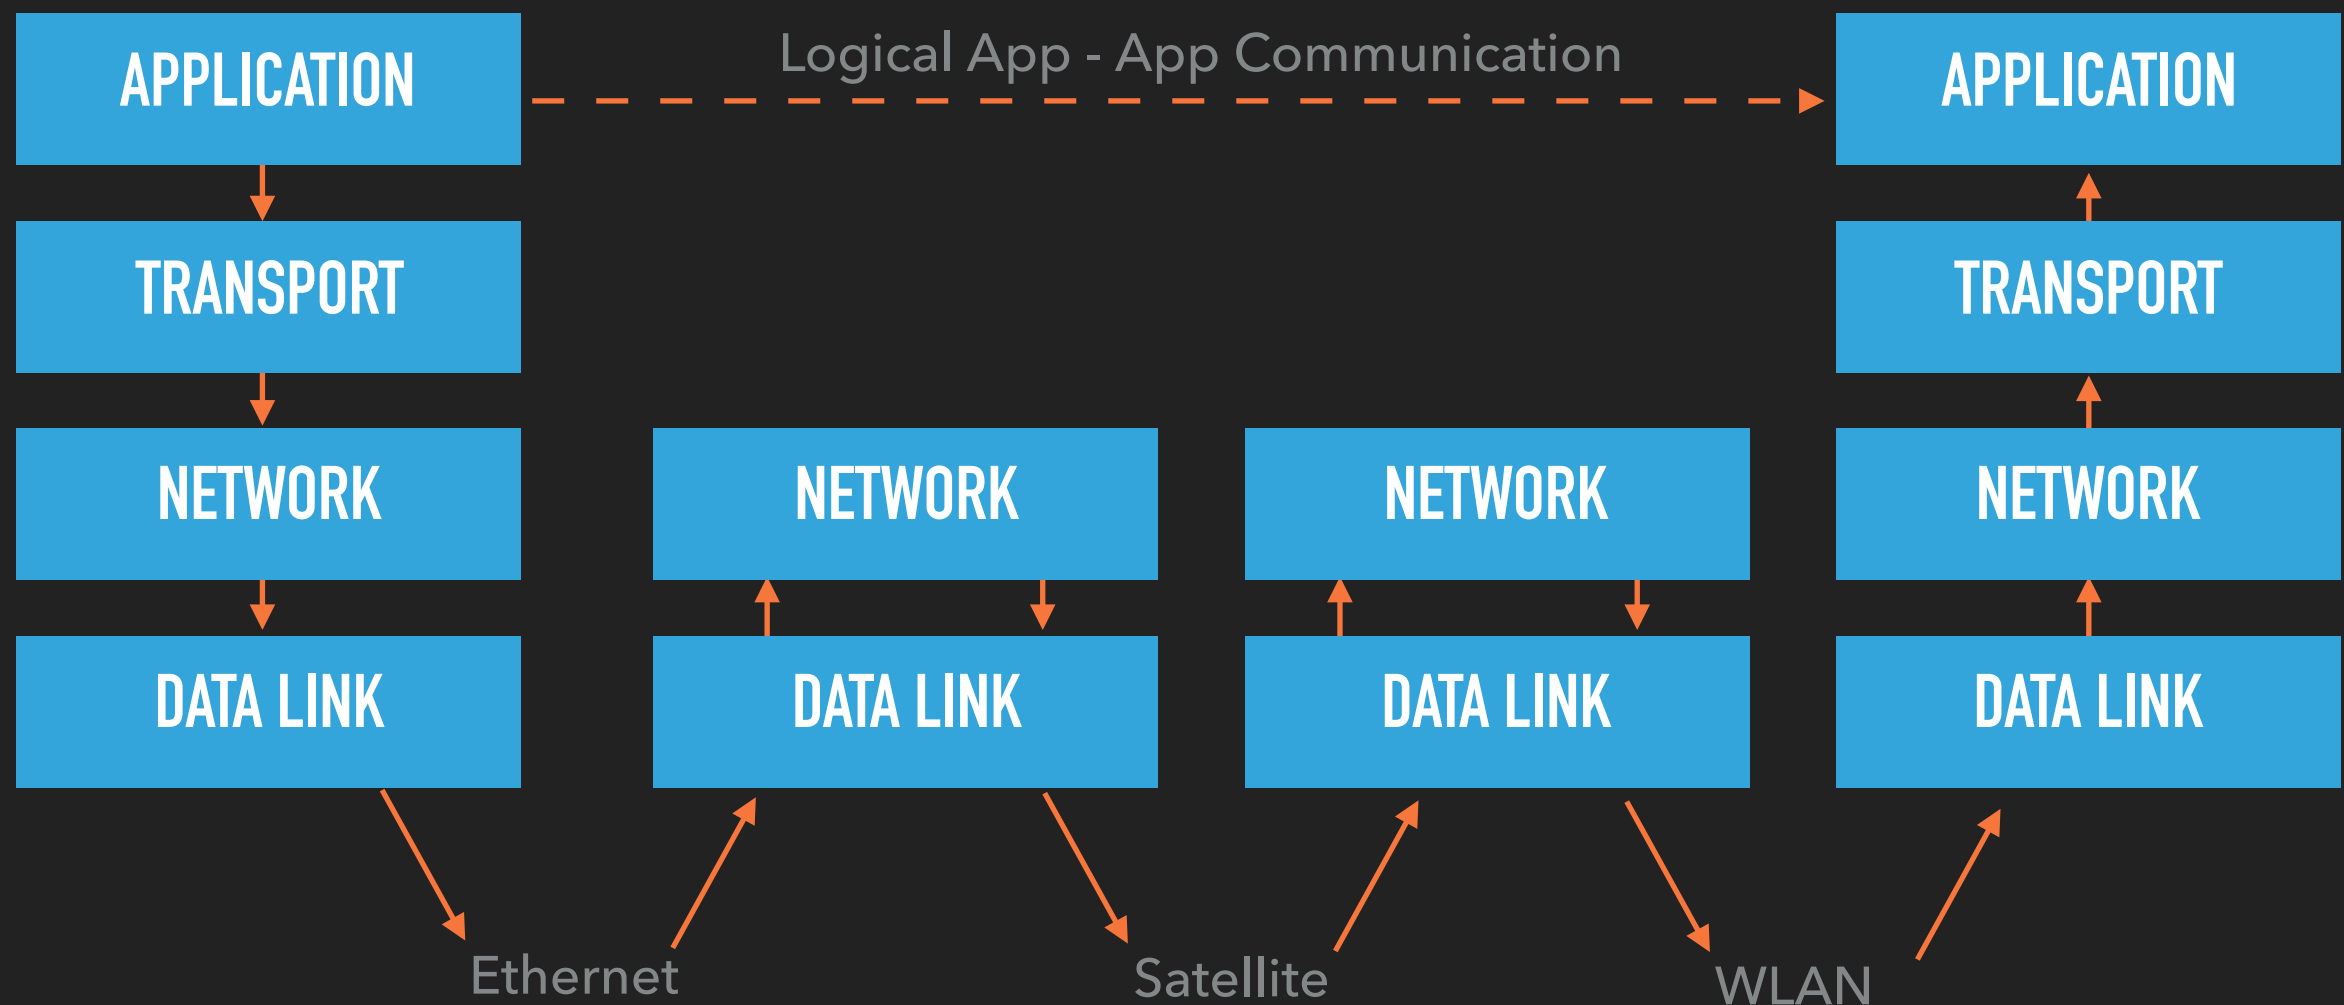

## ► Layering - Protocol Stack

ISO OSI Model

TCP/ IP Model

# DATA FLOW

# APPLICATION LAYER

- ▶ Internet vs Web?
- ▶ HTTP, SMTP, ICMP, DNS
- ▶ Unique ID: (IP, Port)

## APPLICATION LAYER – CTND

- ▶ IP address works until Network layer of destination
- ▶ Above that, Port uniquely identifies the application
- ▶ Socket vs Port

## TRANSPORT LAYER

- ▶ Takes care of host to host communication
- ▶ Reliability
- ▶ Stream / Datagram Transmission
- ▶ Flow Control
- ▶ Congestion control
- ▶ Multiplexing

# TRANSMISSION CONTROL PROTOCOL (TCP)

- ▶ Connection Oriented
- ▶ Reliable
- ▶ Stream

## Client

```
s = socket()

s.connect((ip, port))

s.send() / s.recv()

s.close()
```

## Server

```
s = socket()

s.bind((ip, port))

s.listen(x)

y = s.accept()

y.send() / y.recv()

y.close()

s.close()
```

# USER DATAGRAM PROTOCOL (UDP)

- ▶ connection less
- ▶ Unreliable
- ▶ Doesn't ensure order

## Client

```
s = socket()
```

```
s.sendto() / s.recvfrom()
```

```
s.close()
```

## Server

```
s = socket()
```

```
s.bind((ip, port))
```

```
y.sendto() / y.recvfrom()
```

```
y.close()
```

```
s.close()
```

## NETWORK LAYER

- ▶ Unique Host addressing
- ▶ Routing and Forwarding messages
- ▶ Fragmentation / Reassembly

**IPv4** - 32 bit address -  $2^{32} = 4,294,967,296$

**IPv6** - 128 bit address -  $2^{128} = 3.40 * 10^{38}$

# ROUTING

- ▶ Several routing algorithms
- ▶ Routing table maintained at Network layer
- ▶ Centralized / decentralized

## DATA LINK LAYER

- ▶ Responsible to get the packet across to the next node over the link
- ▶ Framing data
- ▶ Medium Access Control
- ▶ Unique hard-wired physical address

## PHYSICAL LAYER

- ▶ Ethernet cable
- ▶ WiFi
- ▶ Satellite Link
- ▶ Fiber Optic Cable

# SECURITY

- ▶ Malware
- ▶ Denial of Service Attacks
- ▶ Botnets
- ▶ Trojans
- ▶ Phishing
- ▶ Protocol and Application vulnerability

# MALWARE

- ▶ Any software that functions with a malicious intent.
- ▶ **Rootkits** are the worst of kind
- ▶ They could potentially lodge the malware into kernel space and in some cases even at the firmware level

## IDENTIFICATION AND REMOVAL – ROOTKITS

- ▶ Signature Detection
- ▶ Memory Dump
- ▶ OS reinstall
- ▶ Change of Hardware

## DENIAL OF SERVICE ATTACKS

- ▶ Steep artificial increase in contention for a shared resource
- ▶ Prevents legitimate users from accessing
- ▶ Utilizes protocol vulnerability

Ping of death

R-U-Dead-Yet?

SYN flood

SMS bomb

Farewell Attack

# BOTNETS

- ▶ Network of compromised devices under the command of an the attacker.
- ▶ They are capable of performing **Distributed Denial of Service (DDoS)**
- ▶ Bots could potentially steal information out using **Backdoors**

# BOTNET ARCHITECTURE

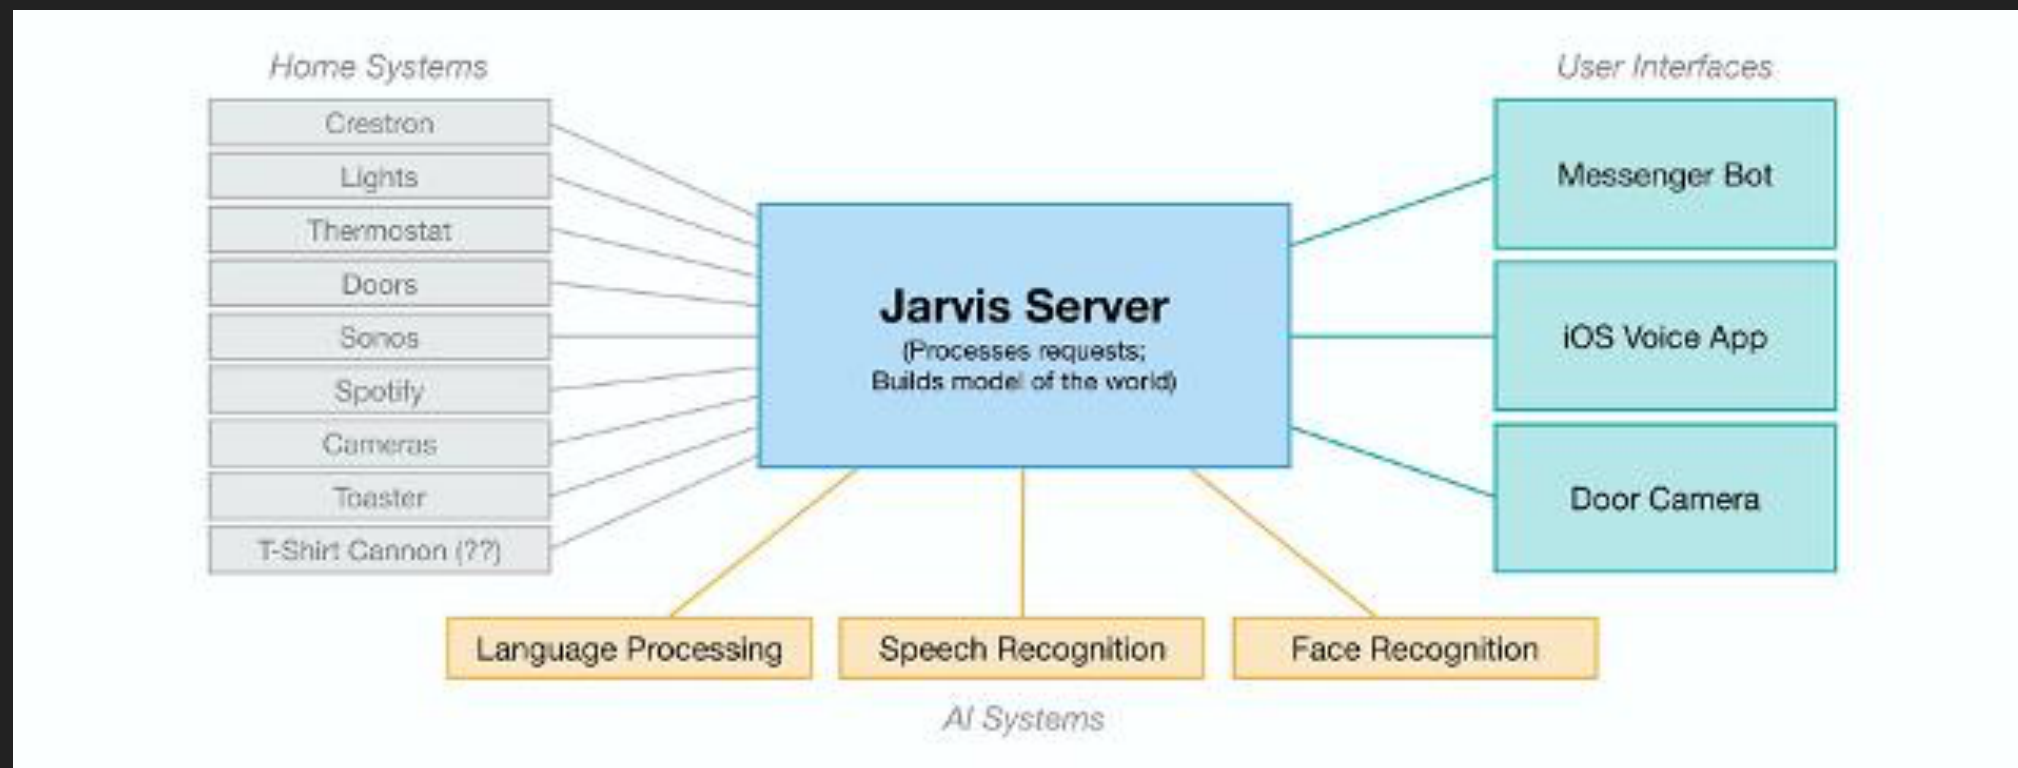

# JARGON – WIRELESS SENSOR NETWORKS

## JARGON – INTERNET OF THINGS (IOT)

- ▶ Inter-networking of everyday things such as TV, AC, Doors, Mobiles, Audio system, Vehicles, Stove etc
- ▶ Mark Zuckerberg's ambitious goal for 2016 - **J.A.R.V.I.S**

# JARGON – SOFTWARE DEFINED NETWORKING
